

Hello and hope this finds you well,

### **Structure of the Project :**

You can find the project in the “*Tendergy Task/src/test/java*” folder.

These tests are written based on **Page Object Model** design pattern.

There is a “**pages**” package where you can find every page element's locators in their related class.

In the “**testCases**” package there are small test cases related to the register installer section.

In the “**testScenarios**” package there is a test class that is using test cases to make test scenarios for Register Installer.

### **For running tests :**

Go to “*Tendergy Task/src/java/testScenarios/RegisterInstaller*”.

There you can run the whole class to run tests sequentially after each other, or you can run each test scenario individually.
